All urinal bowls are fitted with an individual presence detector which is recessed into the panel directly above each urinal bowl, and thus only the urinal bowl that has actually been used will get flushed. Flushing will only occur if a person has been constantly detected by the sensor for at least 10 seconds (this is to prevent false triggering if someone just walks down the line of urinal bowls) and the flush happens within a few seconds of that person walking away out of detection range of the sensor. Optional programmable automatic hygiene flush.

Sensor / Touchpad Switch

Do NOT mount these A.I.R. (active infrared) sensors on opposite walls, "looking" into each other across an empty void, as this can cause the sensor to malfunction. Ensure no bright lights (or reflected lights) are shining directly into sensor.

If fitting sensor/touchpad through a thick (e.g. brick) wall, we can supply extension threads. Standard pre-wired sensor c/w 3m cable. Longer cable lengths available. *Call to discuss.*

Control Box

Standard tap control box with adjustable valve open time from 1 seconds to 15 seconds. You need to provide a 3 amp fused spur.

Optional combined pre-flush and purge facility: The pre-flush opens the valve for 1 second after the first 2 seconds of detection. This helps to prevent splashing by wetting the urinal bowl. After the pre-flush the timing continues. The purge is initiated every 12 hours of non-use on either channel. This helps reduce smells from the urinal during periods of non-use.
